

THRONIX FRONTEND — PRODUCT REQUIREMENTS DOCUMENT

Schedule A to the Software Development Agreement

This Product Requirements Document (PRD) sets out the agreed, itemised scope and the objective acceptance criteria for the frontend engagement. It forms Schedule A of the Software Development Agreement and is the test against which Build Acceptance and Final Acceptance are measured. Anything not contained in this PRD is out of scope and is handled as a change order under Clause 9.2 of the Agreement.

1. Overview

The Developer is engaged to build the frontend only, comprising two deliverables:

- Deliverable A — the company website / landing page.
- Deliverable B — the frontend (user interface) of the main Thronix software, integrating with the Thronix backend.

The backend is being finalised in parallel and is outside this engagement. The frontend must integrate with it and accommodate changes as the backend is finalised (see Section 4).

2. Deliverable A — Company Website / Landing Page

A responsive marketing website / landing page comprising the following sections:

- Hero section — headline, subhead, primary call-to-action.
- Product / features overview.
- How it works.
- Plans (to be confirmed).
- About / team.
- Testimonials / social proof.
- Contact / lead-capture form and call-to-action.
- Footer: navigation, legal links, social links.
- Site-wide: responsive layout, basic SEO meta tags, favicon, social/OG preview tags, and contact-form submission target / email or backend endpoint.
- Content: provided by Client / written by Developer.

3. Deliverable B — Thronix Software Frontend

The user interface of the main software, implementing the agreed screens and flows and integrating with the backend APIs. Screens / modules to be built.

Authentication — login, sign-up, password reset (using backend-provided auth).

- Primary dashboard / home — (key data and actions).
- Core workflow screen(s) — list each screen and its main actions.
- Detail / record view.
- Settings / profile.

- Any admin / management screens.

Across all screens: API integration with the backend; loading, empty, and error states; form validation; responsive layout; and consistent navigation.

4. Backend Integration & Change Handling

The frontend integrates with the backend, which is being finalised in parallel. During the Backend Integration & Support Period (running until backend finalisation, subject to the longstop in Schedule B of the Agreement), the Developer shall, at no additional charge:

- keep the agreed screens and flows working as the backend is finalised — including adapting the frontend to backend API or data-contract changes, and fixing integration issues; and
- correct any defect (anything that fails this PRD).

For clarity, this covers changes needed to integrate and keep the agreed scope working as the backend evolves. It does not include net-new features, new screens, or new product functionality beyond this PRD, which are handled as change orders (Clause 9.2 of the Agreement), with a separate fee and timeline agreed in writing.

5. Cross-cutting requirements

- Tech stack: e.g., Next.js, TypeScript, Tailwind.
- Design source: Figma / design-system link the build must follow.
- Responsive / browser targets: latest Chrome, Safari, Firefox, Edge; mobile, tablet, and desktop breakpoints.
- Code delivered to the shared repository, reasonably documented, with a complete dependency list at handover (permissive licences per Schedule C).

6. Acceptance criteria (objective)

- Build Acceptance: every confirmed item in Sections 2 and 3 is implemented and verified; the frontend and landing page run end-to-end on a fresh deployment without error; and the responsive, performance, and accessibility targets in Section 5 are met.
- Final Acceptance: successful completion of the pilot, with backend integration stable and the changes required under Section 4 incorporated, by the end of the Backend Integration & Support Period (or the longstop date in Schedule B).

7. Out of scope

- Backend development and backend APIs (provided by the Client).
- Third-party certification.

8. Assumptions & dependencies

- The Client provides timely access to the backend APIs and data contracts, and to designs/content where these are Client-supplied.
- The Client provides feedback within the review windows in Clause 4 / Schedule B of the Agreement.
- Backend finalisation is the Client's responsibility; delays in it extend the Integration & Support Period by agreement rather than counting as Developer delay.

9. Sign-off

The Parties confirm this PRD is the agreed Schedule A scope and acceptance criteria.
